1. Problems Encountered During Implementation: The actual project itself went pretty smoothly until the end. I am unable to figure out why my project will not grade on gradescope. It works perfectly fine on my local machine and my linux virtual machine so I don't know what to do anymore. Even after the milestone, I am unable to figure out my Gradescope issues. I have asked in Discord and asked Tas but it hasn't been fruitful in finding a solution.
2. The BST is badly made but I have segmentation faults when calling the query and attempting to output my file. The hash table is partially implemented
3. I had significant interactions which are logged on discord initially discussing the requirements of the project. I had a discussion talking about pointers and how to manage segmentation faults I then had discussion when brainstorming why my project did not submit on grade scope.
4. [A Simple Makefile Tutorial \(colby.edu\)](#) [Building Heap from Array - GeeksforGeeks](#)
